

One ciphertext holds 32,768 slots

4 activation copies × 1,024 padded features × 8 token lanes = 32,768 slots. The 4 copies exist because the MLP expands to 4× the hidden width.

103 tokens occupy 13 ciphertext groups

600 bp ÷ 6-mer = 100 tokens, plus 3 task specials = 103. 103 tokens across 8 lanes rounds up to 13 groups; the final group is partly padded.

The 13 groups give 91 lower-triangular causal score tiles, and just 1 of the 104 lanes is padding.
