

One ciphertext holds 32,768 slots

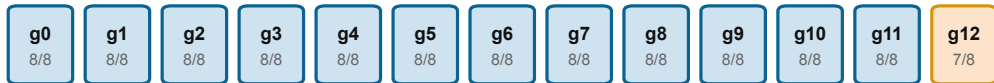

$4 \text{ copies} \times 1,024 \text{ features} \times 8 \text{ token lanes} = 32,768 \text{ slots}$. The copies carry the $4 \times$ MLP expansion.

103-token genomic-signal benchmark: 600 bp $\rightarrow$ 13 ciphertext groups

$600 \text{ bp} \div 6\text{-mer} = 100 \text{ tokens} + 3 \text{ task specials} = 103$. Longest encrypted-scope classification prompt.

8 token lanes give 13 groups; the final group has one padded lane.

The 13 groups give 91 lower-triangular causal score tiles, and just 1 of the 104 lanes is padding.
